

# Chronic Myeloid Leukemia (CML)

## Patient Journeys

Chronic Myeloid Leukemia (CML) is a type of cancer that affects the blood and bone marrow. It is caused by a genetic mutation that leads to the production of abnormal white blood cells. CML is typically diagnosed through a blood test and a bone marrow biopsy. The disease is characterized by an overproduction of white blood cells, which can lead to symptoms such as fatigue, weight loss, and an enlarged spleen. Treatment for CML typically involves targeted therapy, which can help to control the disease and improve quality of life. The patient journey for CML often involves a long-term commitment to treatment and regular monitoring by a healthcare provider.
